Week4:

I added the spring Beans for Hibernate in HomeFoodApplication.java file.

Also added the Index.html and

With Spring Boot it has auto configuration for the in memory databases like H2,Derby ,as I am using the MYSQL database I have to setup the datasource to load the database details.

Also added the beans for the session factory and transaction management.

Issues:

I faced as issue to deploy the project on Heroku.

I got an error saying that the Heroku could not find pom.xml in the github. I could not find the cause of this error, need to cross check if I have missed anything.

GitHub: Added the changes to main branch master :

Java Class with SpringBean Addition
